1. Introduction

1.1 Purpose

This document is a test plan for Bluetooth Protocol Analytical Research System Testing, produced by the System Testing team. It describes the testing strategy and approach to testing the team will use to verify that the application meets the established requirements of the business before release.

1.2 Objectives

- Meets the requirements, specifications, and Business rules.
- Supports the intended business functions and achieves the required standards.
- Satisfies the Entrance Criteria for User Acceptance Testing.

2. Functional Scope

The Modules in the scope of testing for the Bluetooth Protocol Analytical Research System Testing are mentioned in the document attached in the following path:

1. System Requirements Specifications:
<https://docs.google.com/document/d/1iU7k1IXEnjvgXJJy5YyOUKLE0tZp1LD1/edit?usp=sharing&oid=117973657628075055694&rtpof=true&sd=true>
2. Section 3.1 of System Test Plan

3. Overall Strategy and Approach

3.1 Testing Strategy

This section describes how the testing types will be tested, while the latter 3.3 Testing Types discusses what needs to be tested. The Bluetooth Protocol Analytical Research System Testing will include testing of all functionalities that are identified in Section 2: Functional Scope. System testing activities will include the testing of new functionalities, modified functionalities, screen level validations, workflows, functionality access, and testing of internal & external interfaces.

3.1.1 Function Testing

Test Objective: The system communicates, connects, and sends signals according to the specific requirements in the SRS.

Technique: All devices and signals they transmit are properly received by the corresponding device. Problems receiving communication indicate a functional defect.

Completion Criteria: When all use cases have been tested and all defects have been mitigated.

3.1.2 Performance Testing

Test Objective: Ensure that all signals transmit at the correct rate and frequency.

Technique: Use specified software to collect signal data.

Completion Criteria: All signals are properly received and meet the specified performance requirements.

3.2 System Testing Entrance Criteria

To start system testing, certain requirements must be met for testing readiness. The readiness can be classified into usability testing and functional testing.

3.3 Testing Types

3.3.1 Usability Testing

User interface attributes, cosmetic presentation, and content will be tested for accuracy and general usability. The goal of Usability Testing is to ensure that the User Interface is comfortable to use and provides the user with consistent and appropriate access and navigation through the functions of the testbed (e.g., Username/Password, required frequency, payload data.)

System Requirements Specification. 3.1.1 Arduino IDE: "Arduino IDE will be used to push code to the ESP32."

System Requirements Specification. 3.1.2 Zigbee Software: "Zigbee Development software will be used to control the Zigbee Boards in order to send a signal."

System Requirements Specification. 3.1.3 "HackRF Tools: HackRF Tools will be used to control the HackRF One."

System Requirements Specification. 3.1.4 "GNU Radio: GNU Radio will be used to send RF signals via the HackRF One. Users can configure what frequency and range the signals are being sent as well as view Bluetooth packets and signals."

System Requirements Specification. 3.1.5 ".The spectrum analyzer will be used to determine if the HackRF One is correctly transmitting on the right frequency as well as view the data transmitted by Bluetooth and Zigbee devices."

3.3.2 Functional Testing

The objective of this test is to ensure that each element of the component meets the functional requirements of the business as outlined in the:

System Requirements Specification. 3.4.2 "The ESP32 modules will communicate via Bluetooth."

System Requirements Specification. 3.4.3 "The Zigbee modules will communicate via Zigbee."

System Requirements Specification. 3.3.1 "Five Raspberry Pis will be loaded with Kali Linux (or other software) in order to run their respective hardware."

System Requirements Specification. 3.3.2 "HackRF Tools will be used in order to establish a connection with the HackRF One."

System Requirements Specification. 3.3.3 "GNU Radio will be used in order to generate and send RF signals using the HackRF."

System Requirements Specification. 3.3.4 "Data for the ESP32 and Zigbee Boards will be sent via serial from the Raspberry Pis."

System Requirements Specification. 3.3.5 "HackRF Spectrum analyzer will be used to measure the data transmitted by the jammer using a HackRf One."

3.4 Suspension Criteria and Resumption Requirements

This section will specify the criteria that will be used to suspend all or a portion of the testing

activities on the items associated with this test plan.

3.4.1 Suspension Criteria

Testing will be suspended if the incidents found will not allow further testing of the system/application under test. These incidents may include disruption of power, Bluetooth, data, and other functionalities that we require between each device in use. Any anomaly in function will be treated as a reason for suspension. If testing is halted, and changes are made to the hardware, software, or database, it is up to the Testing Manager to determine whether the test plan will be re-executed or part of the plan will be re-executed.

3.4.2 Resumption Requirements

Resumption of testing will be possible when the functionality that caused the suspension of testing has been retested successfully. All test cases must be completed again to confirm the test bed has regained full functionality. This includes ensuring all Bluetooth communication, RF signals, and data transfer amongst system components are now functional.

4. Execution Plan

4.1 Execution Plan

The execution plan will detail the test cases to be executed. The execution plan will be put together to ensure that all the requirements are covered. The execution plan will be designed to accommodate some changes if necessary if testing is incomplete on any day. All the test cases of the projects under test in this release are arranged in a logical order depending upon their inter-dependency.

The test plan for the Bluetooth Protocol Analytical Research system is as follows:

4.1.1 Function Testing (See 3.1.1)

4.1.2 Performance Testing (See 3.1.3)

Requirement (From System Requirements Specification)	Test Case Identifier	Input	Expected Behavior	Pass/Fail
3.1.1 Arduino IDE: Arduino IDE will be used to push code to the ESP32.	1.1	Code written in Arduino IDE	ESP32 transmits/receives data according to the bit stream generated by the Arduino code	Pass
3.1.2 Zigbee Software: Zigbee Development software will be used to control the Zigbee Boards in order to send a signal.	2.1	Code written in Zigbee Development software	Zigbee signal is transmitted	Pass
3.1.3 HackRF Tools: HackRF Tools will be used to control the HackRF Ones.	3.1	Code written using HackRF Tools	HackRF receives transmitted data	Pass

3.1.4 GNU Radio: GNU Radio will be used to send RF signals via the HackRF One	4.1	Data given to GNU Radio	HackRF receives the data	Pass
3.1.4 GNU Radio can configure what frequency and range the signals of the data being transmitted	5.1	Desired frequency and range of transmission	Data transmitted at the desired frequency and range	Pass
3.1.5 The spectrum analyzer will be used to determine if the HackRF One is correctly transmitting on the right frequency as well as view the data transmitted by Bluetooth and Zigbee devices.	6.1	Bluetooth packets being received through HackRF spectrum analyzer	Received data being read as signals	Pass
3.1.6 New firmware can be edited and downloaded onto Flipper Zero when the Flipper Zero is USB connected to the given laptop.	7.1	Flipper Zero is connected to laptop with qFlipper installed via USB cable	The Flipper Zero files appear in the qFlipper application	Pass
3.4.1 The HackRF, Zigbee, and ESP32 Bluetooth modules shall connect to the Raspberry Pis via USB type A to USB micro B.	8.1	Command 'lsusb' is inputted in Raspberry Pi terminal	The respective device appears in list of all connected USB devices	Pass
3.4.2 The ESP32 modules will communicate via Bluetooth.	9.1	Data transmitted from one Bluetooth module	Another Bluetooth module receives the data	Pass
3.4.3 The Zigbee modules will communicate via Zigbee.	10.1	Data transmitted from one Zigbee module	Another Zigbee module receives the data	Pass
3.4.4 Peripherals such as the keyboard and mouse shall connect via USB type A.	11.1	Keyboard and mouse as physically connected to Raspberry Pi with USB type A cable	Keyboard and mouse actions output on display	Pass
3.4.5 The displays shall connect via micro HDMI to HDMI.	12.1	Display is plugged into Raspberry Pi via micro HDMI to HDMI cable	The display powers on	Pass
3.4.6 The Raspberry Pis shall be powered via a USB type C.	13.1	USB type C cable is plugged into Raspberry Pi	Raspberry Pi powers on	Pass

3.4.7 The Flipper Zeros shall communicate via BLE.	14.1	Code written using qFlipper	Connection established with target device	Pass
3.3.1 Five Raspberry Pis will be loaded with Kali Linux (or other software) in order to run their respective hardware.	15.1	Raspberry Pi is powered on and connected to the monitor	Each Raspberry Pi displays the proper operating system on the monitor	Pass
3.3.2 HackRF Tools will be used in order to establish a connection with the HackRF One.	16.1	Code written using HackRF Tools	Connection established with HackRF One	Pass
3.3.3 GNU Radio will be used in order to generate and send RF signals using the HackRF.	17.1	Desired data to be transmitted	Desired data transmitted using the HackRF	Pass
3.3.4 Data for the ESP32 and Zigbee Boards will be sent via serial from the Raspberry Pis.	18.1	Data from the Raspberry Pi	The ESP32/Zigbee board receives the data via serial	Pass
3.3.5 HackRF Spectrum analyzer will be used to measure the data transmitted by the jammer using a HackRf One.	19.1	Data from HackRF One	Measure data transmitted by jammer	Pass
3.3.6 New firmware shall be installed onto Flipper Zero via qFlipper.	20.1	Install button is pressed corresponding to the new firmware	Firmware is successfully installed on Flipper Zero	Pass

5. Traceability Matrix & Defect Tracking

5.1 Traceability Matrix

Requirement CRITICAL: System Requirements Specification, 3.1.1: “Arduino IDE will be used to push code to the ESP32.”

Test Cases: ESP32 should display a status light indicating data transmitted.

Requirement CRITICAL: System requirements Specifications, 3.1.2: “Zigbee Development software will be used to control the Zigbee Boards in order to send a signal.”

Test Cases: Zigbee device will display a status light to indicate data has been received.

Requirement CRITICAL: System requirements Specification, 3.1.3 “HackRF Tools will be used to control the HackRF Ones.”

Test Cases: HackRF tools will indicate connection through Linux terminal.

Requirement CRITICAL: System requirements Specification, 3.1.4: “GNU Radio will be used to send RF signals via the HackRF One.”

Test Cases: Check that data is being set to HackRF One.

Requirement CRITICAL: System requirements Specification, 3.1.4: “GNU Radio can configure what frequency and range the signals of the data being transmitted.”

Test Cases: Check that frequency is adjusted properly in GNU Radio.

Requirement LOW: System requirements Specification, 3.1.5: “The spectrum analyzer will be used to determine if the HackRF One is correctly transmitting on the right frequency as well as view the data transmitted by Bluetooth and Zigbee devices.”

Test Cases: Check if signals appear on HackRF Spectrum analyzer.

Requirement LOW: System requirements Specification, 3.1.6: “New firmware can be edited and downloaded onto Flipper Zero when the Flipper Zero is USB connected to the given laptop.”

Test Cases: Check if new firmware appears on Flipper Zero.

Requirement LOW: System requirements Specification, 3.4.1: “The HackRF, Zigbee, and ESP32 Bluetooth modules shall connect to the Raspberry Pis via USB type A to USB micro B.”

Test Cases: Check if devices are properly connected to Raspberry Pi.

Requirement CRITICAL: System requirements Specification, 3.4.2: “The ESP32 modules will communicate using Bluetooth”.

Test Cases: Check if one ESP32 received data from another ESP32 via Bluetooth.

Requirement CRITICAL: System requirements Specification, 3.4.3: “The Zigbee modules will communicate via Zigbee.”

Test Cases: Check if one Zigbee module receives data from another Zigbee module via Zigbee.

Requirement LOW: System requirements Specification, 3.4.4: “Peripherals such as the keyboard and mouse shall connect via USB type A.”

Test Cases: Check if the devices are properly connected to Raspberry Pi.

Requirement LOW: System requirements Specification, 3.4.5: “The displays shall connect via micro HDMI to HDMI.”

Test Cases: Check if the display is powered on by Raspberry Pi.

Requirement LOW: System requirements Specification, 3.4.6: “The Raspberry Pis shall be powered via a USB type C.”

Test Cases: Check if the Raspberry Pi is powered on.

Requirement CRITICAL: System requirements Specification, 3.4.7: “The Flipper Zeros shall communicate via BLE.”

Test Cases: Check if the Flipper Zero communicates with the target device.

Requirement MEDIUM: System requirements Specification, 3.3.1: “Five Raspberry Pis will be loaded with Kali Linux (or other software) in order to run their respective hardware.”

Test Cases: Check if Raspberry Pi boots into Kali Linux.

Requirement CRITICAL: System requirements specification, 3.3.2: “HackRF Tools will be used in order to establish a connection with the HackRF One.”

Test Cases: Check if HackRF communicates with HackRF Tools.

Requirement CRITICAL: System requirements Specification, 3.3.3: “ GNU Radio will be used in order to generate and send RF signals using the HackRF.”

Test Cases: Check that the HackRF receives input from GNU Radio.

Requirement MEDIUM: System requirements Specification, 3.3.4 “Data for the ESP32 and

Zigbee Boards will be sent via serial from the Raspberry Pis.”

Test Cases: Check if the Raspberry Pi receives data from the ESP32 and Zigbee modules via serial connection

Requirement MEDIUM: System requirements Specification, 3.3.5 “HackRF Spectrum analyzer will be used to measure the data transmitted by the jammer using a HackRf One.”

Test Cases: Check if the spectrum analyzer records the transmissions from the jammer.

Requirement LOW: System requirements Specification, 3.3.6 “New firmware shall be installed onto Flipper Zero via qFlipper.”

Test Cases: Check if qFlipper installs the firmware.

5.2 Defect Severity Definitions

Critical	The defect causes a catastrophic or severe error that results in major problems and the functionality rendered is unavailable to the user. A manual procedure cannot be either implemented or a high effort is required to remedy the defect. Examples of a critical defect are as follows: <ul style="list-style-type: none">• System abends• Data cannot flow through a business function/lifecycle• Data is corrupted or not transmitted
Medium	A defect that does not seriously impair system function can be categorized as a medium defect. A manual procedure requiring medium effort can be implemented to remedy the defect. Examples of a medium defect are as follows: <ul style="list-style-type: none">• Data collection is inaccurate• Data is transmitted on incorrect frequency
Low	The defect is cosmetic or has little to no impact on system functionality. A manual procedure requiring low effort can be implemented to remedy the defect. Examples of a low defect are as follows: <ul style="list-style-type: none">• Repositioning of fields on screens• Text font on reports is incorrect

6. Environment

6.1 Environment

- The System Testing Environment will be used for System Testing.

The Bluetooth System will be composed of the following devices:

- Raspberry Pi 4 8GB Model B
- ESP 32 Development Board with Integrated Bluetooth

The Zigbee System will be composed of the following devices:

- Raspberry Pi 4 8GB Model B
- Zigbee Development Board (IOTZTB-DK0006)

The Software Defined Radio System will be composed of the following devices:

- Raspberry Pi 4 8GB Model B
- HackRF One

7. Assumptions

This section lists assumptions made specific to this project.

- All forms of interaction with Bluetooth would be done under the 5.0 Standard
- The devices will only be interacting with each other and nothing not specifically specified in the environment.

- There are no external RF signals on the same or similar frequencies.
- Transmitter and receiver are within 5 feet of each other.
- There are no objects or walls between the transmitter and receiver.
- The user has downloaded and installed all required software.

8. Risks and Contingencies

Risk #	Risk	Impact	Contingency plan
1	Hardware Malfunctions	Medium	Obtain in reserve multiple hardware devices that can easily be broken or lost such as ESP32, antennas, cables and peripherals. Diagnose and replace the malfunctioning part.
2	Software Malfunctions	Medium	Keep a record of all software and files used. Use a debugger or software manual to identify the issue.
3	Data Corruption Risks	Medium	Maintain backups of operations systems and software to ensure redundancy. When corrupted data is found, remove and replace with backup uncorrupted data.
4	Signal Interference	High	Conduct all testing in a controlled environment where signals are controlled. If interference is detected, identify and remove the source of signal interference.
